

EUMeTrain – MTG-I Event Week

24 June 2025 – 12:00 UTC

The new RGBs from FCI and their main areas of application

Andreas Wirth
andreas.wirth@geosphere.at

Introduction:

- The FCI sensor has new channels, mainly in the short wave spectrum (0.44 μm , 0.51 μm , 0.91 μm , 1.38 μm and 2.25 μm)
- They can be used to create “new” RGBs, mainly for daytime use.

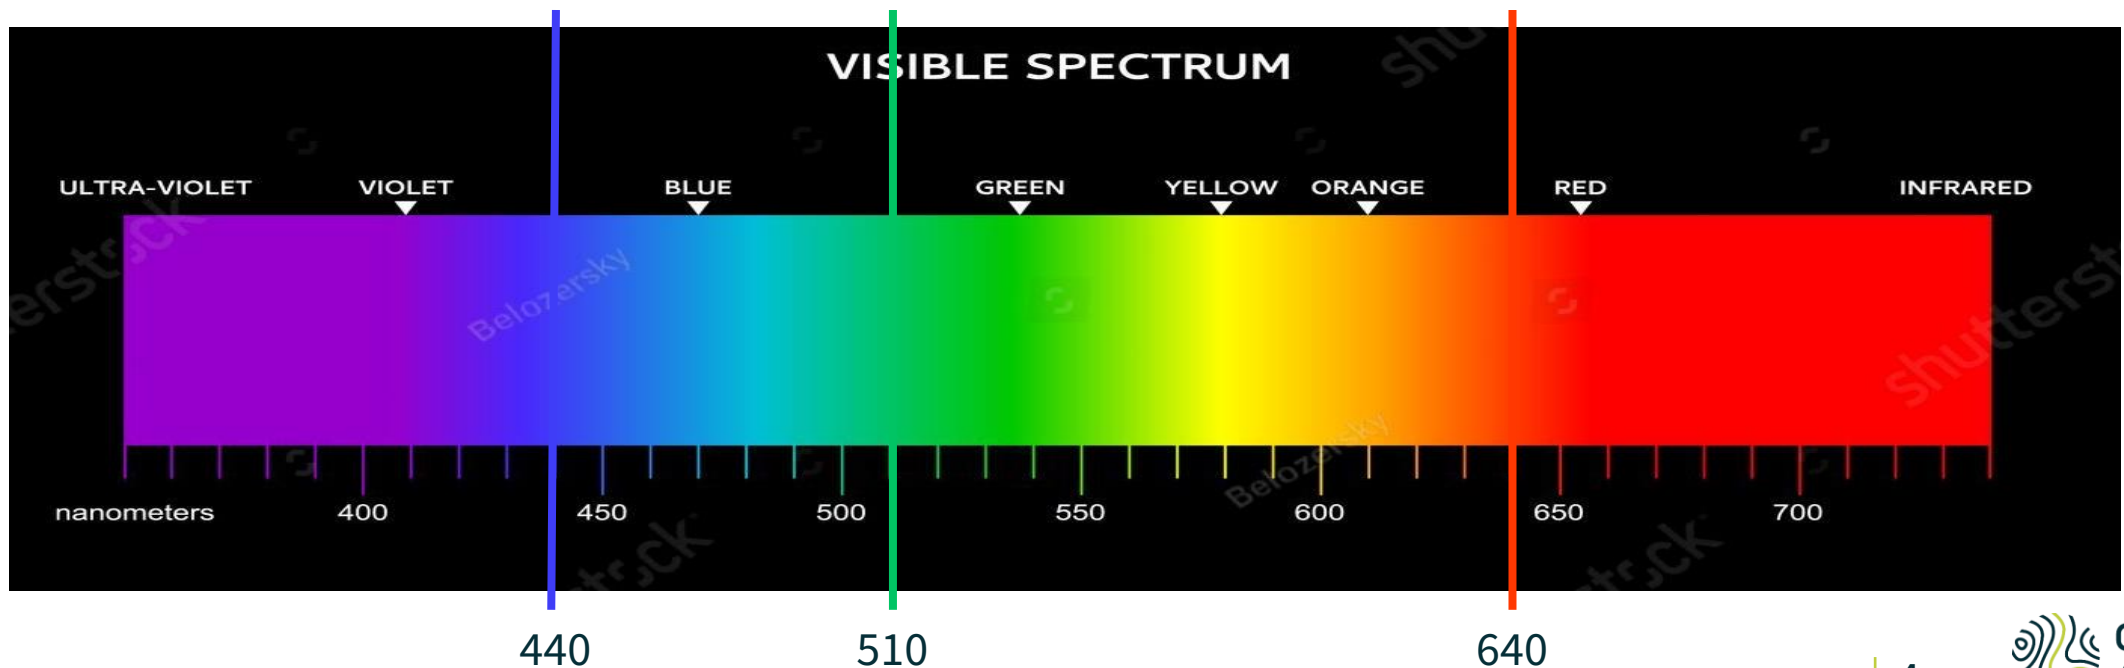

This presentation will not provide a complete description of each new RGBs, but instead focus on the most important information they provide.

... and include a pro/con list reflecting their strong and weak sides.

- 1. The True Colour RGB**
- 2. The Cloud Phase RGB**
- 3. The Cloud Type RGB**
- 4. The Fire Temperature RGB**

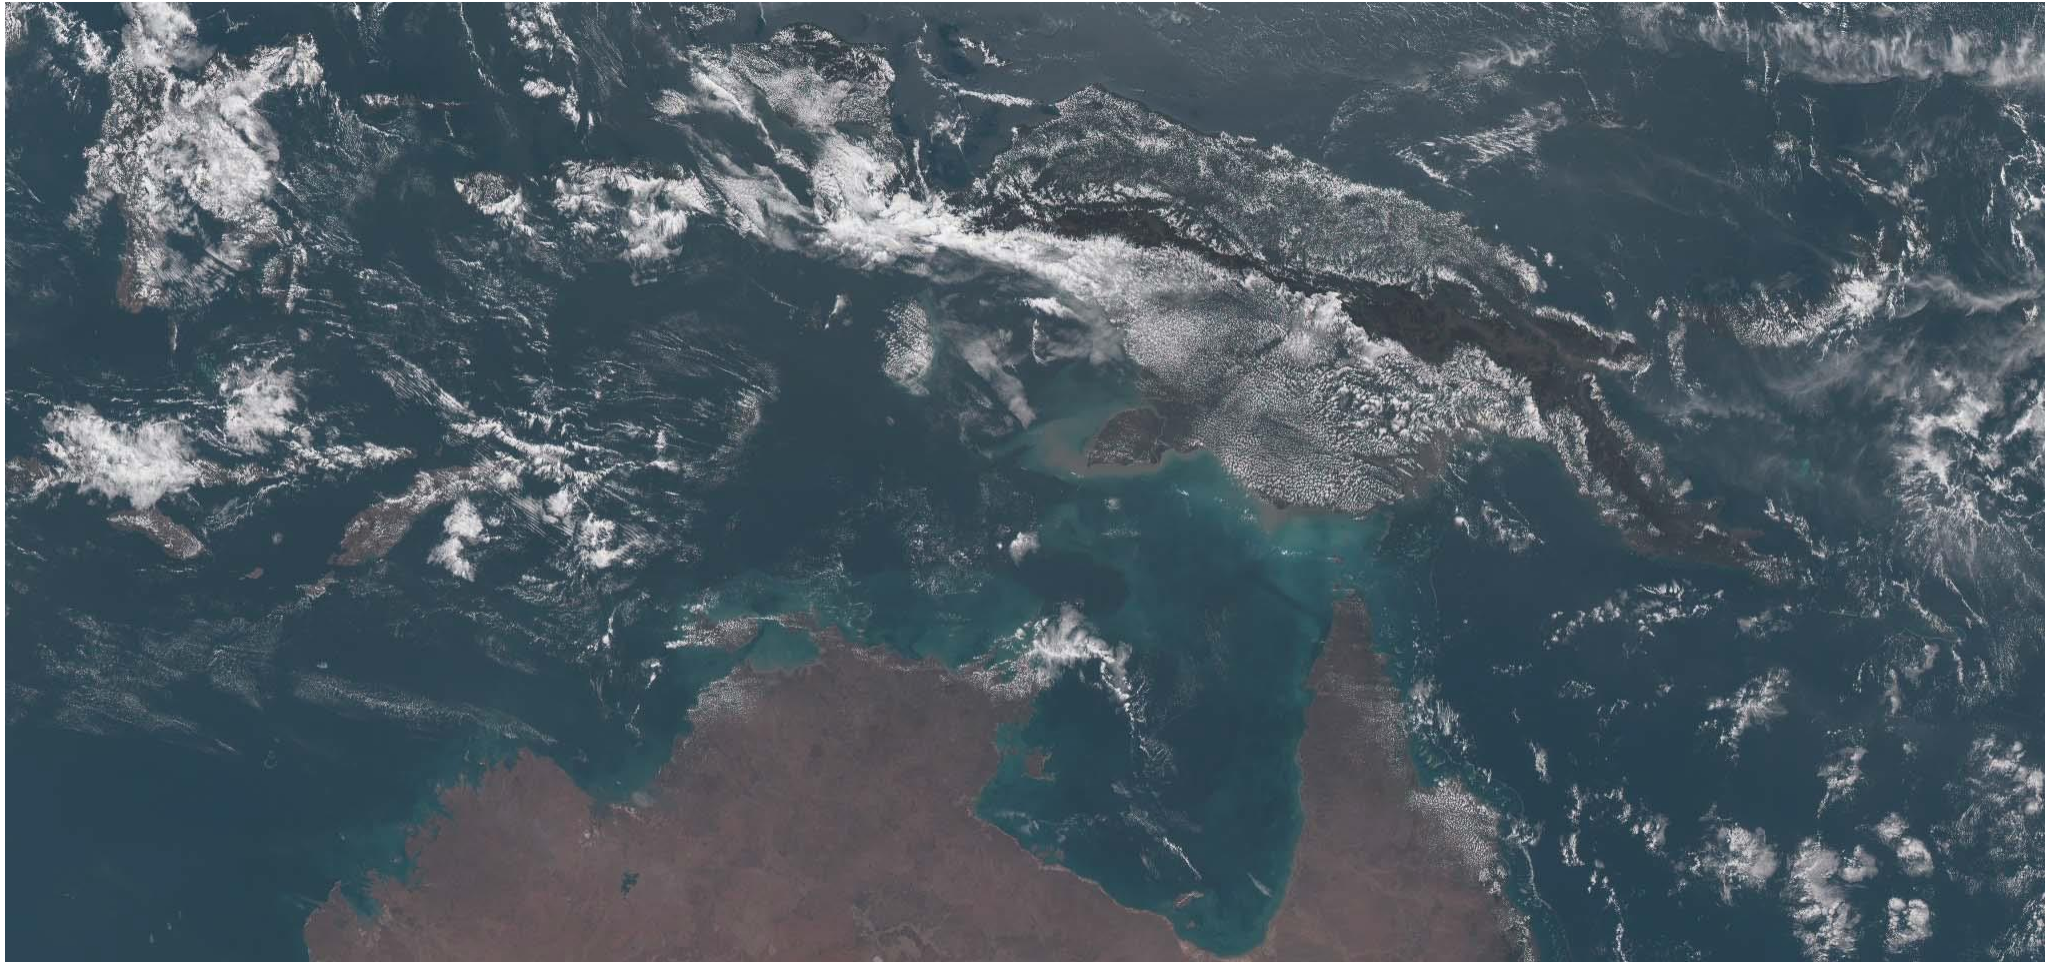

The True Colour RGB

Colour	Channel [μm]	Physically relates to	Smaller contribution to the signal	Larger contribution to the signal
Red	VIS0.64	Cloud optical thickness, vegetation, aerosols	Thin clouds	Thick clouds
Green	VIS0.51	Cloud optical thickness, vegetation, aerosols	Thin clouds Dry vegetation	Thick clouds Green vegetation
Blue	VIS0.44	Cloud optical thickness, vegetation, aerosols	Thin clouds	Thick clouds

The True Colour RGB – Fog and low clouds

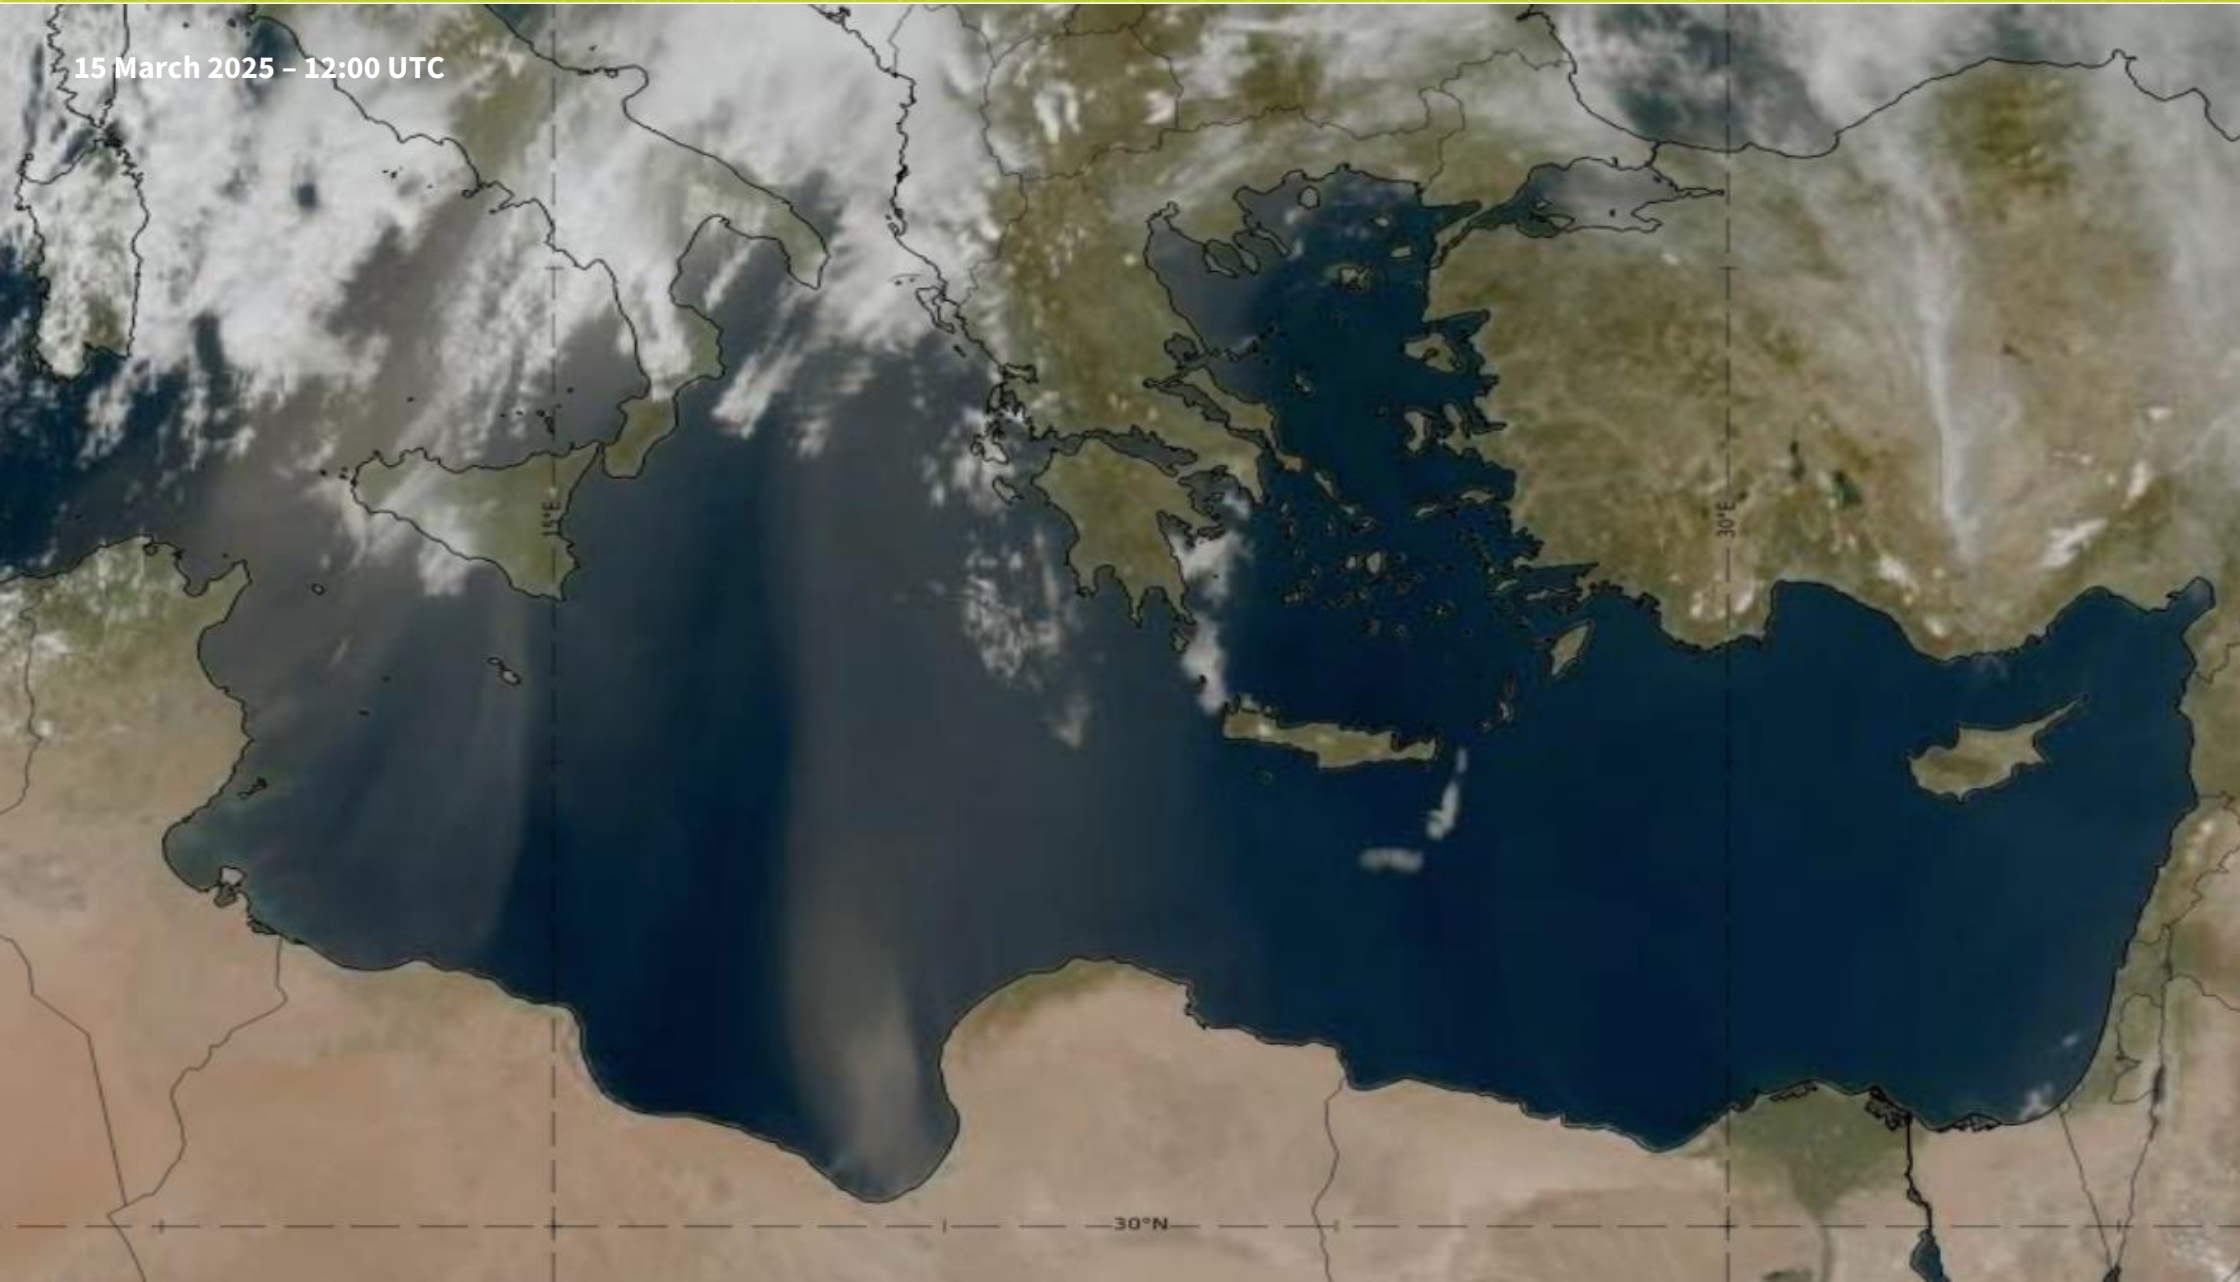

The True Colour RGB – Smoke

9 June 2025 – 16:00 UTC

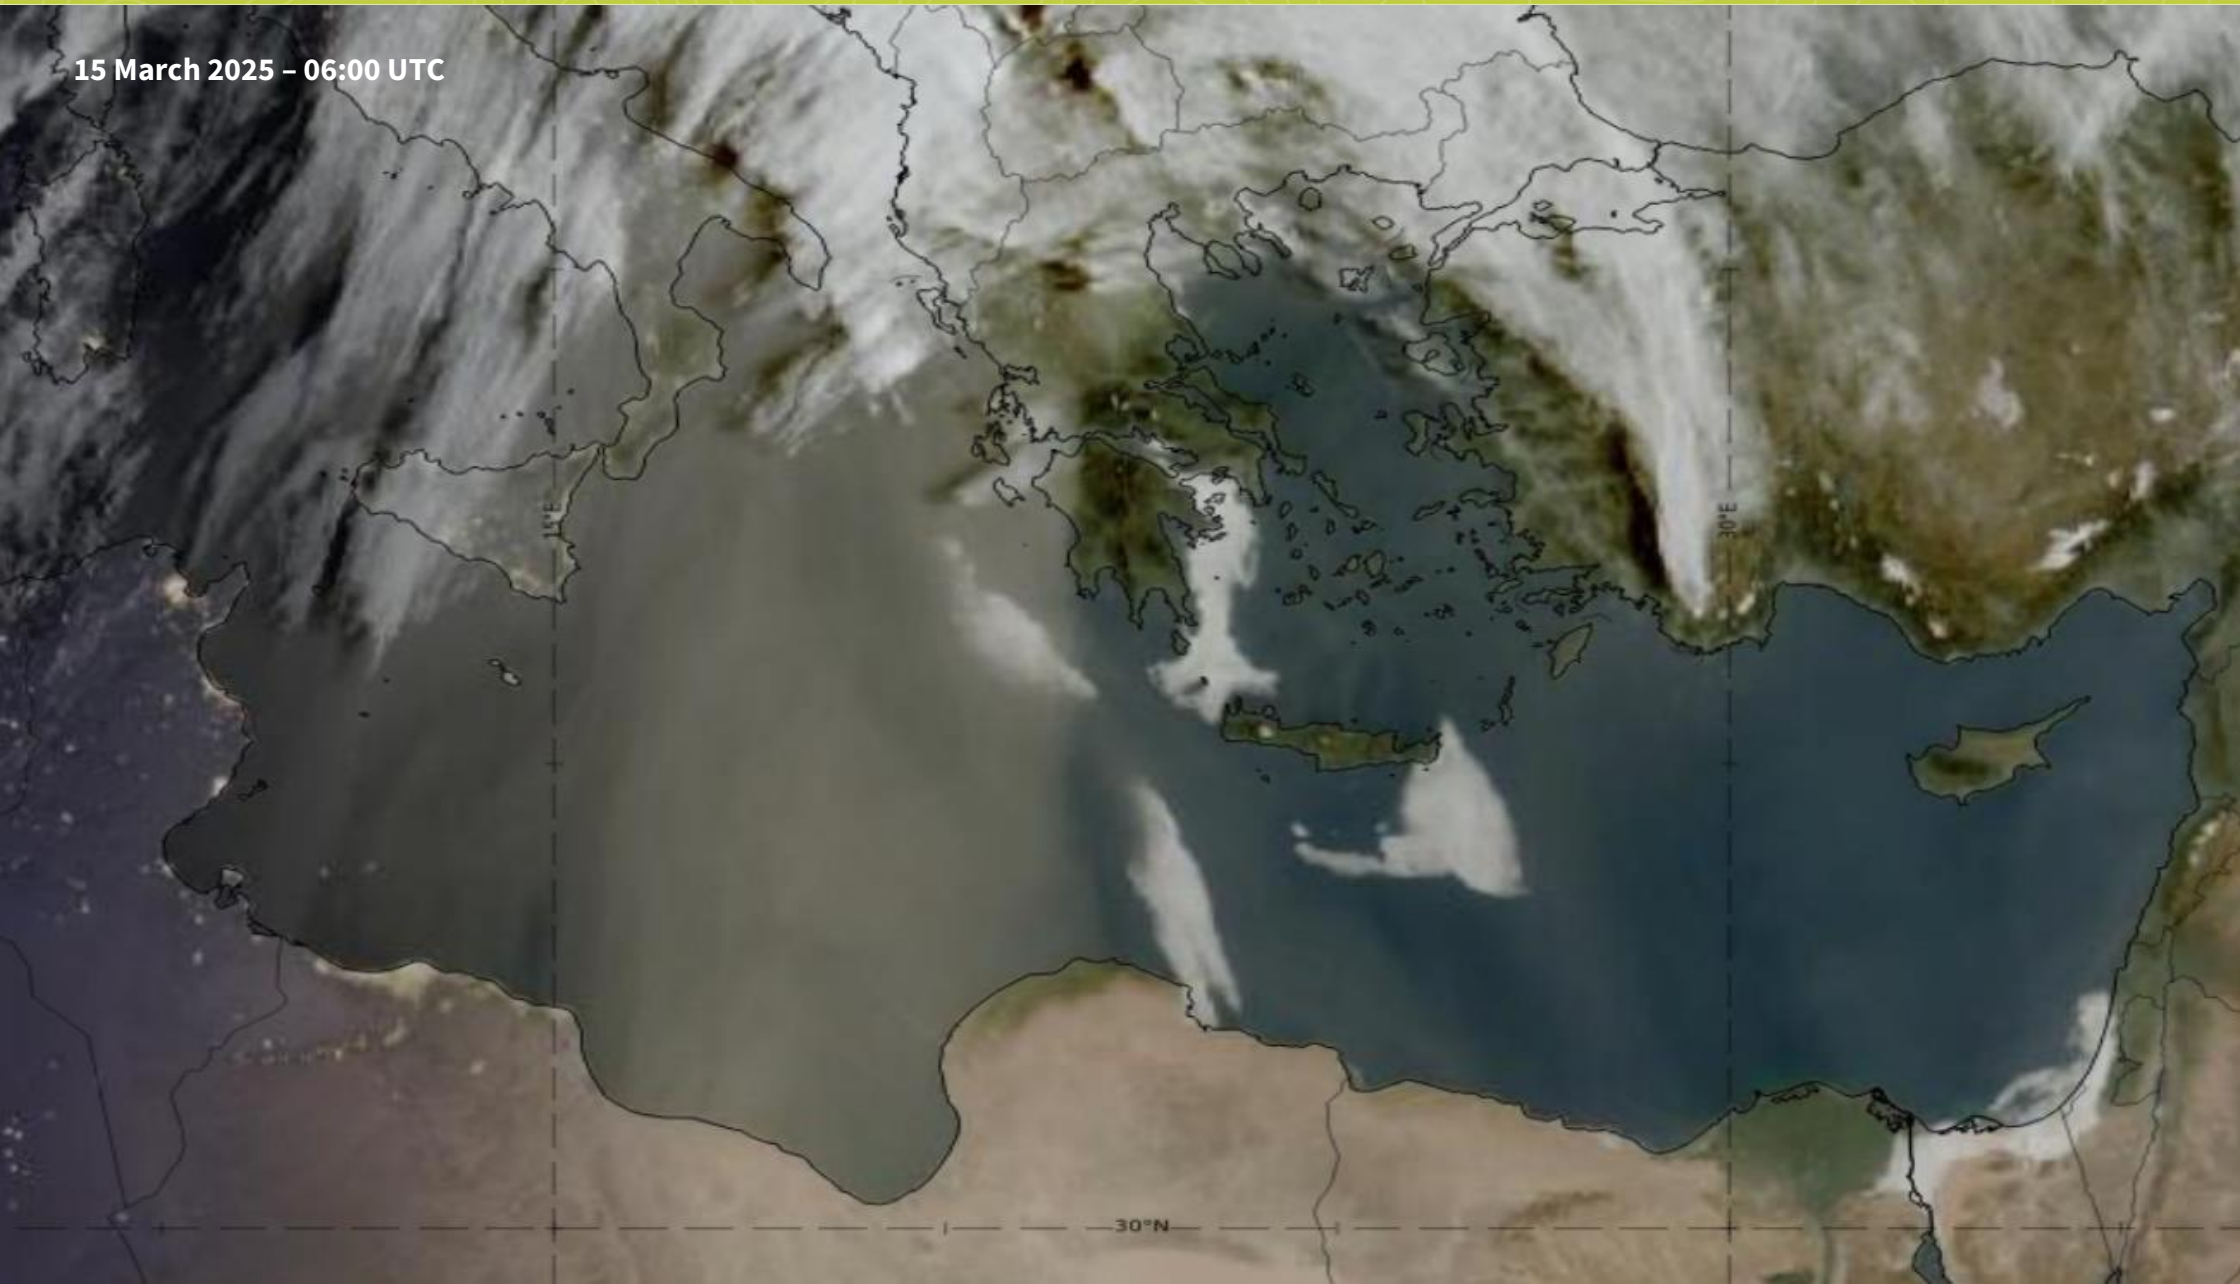

The True Colour RGB – Dust

15 March 2025 – 12:00 UTC

The True Colour RGB – Dust – Low Solar Angle

15 March 2025 – 06:00 UTC

Pros

- Easy to interpret
- Surface features, vegetation
- Sensitivity to aerosols (smoke)
- Optical thickness of clouds
- Sea sediments and algae bloom

Cons

- Daytime only
- No cloud height information
- Dust harder to detect over land (deserts)

The Cloud Phase RGB

Colour	Channel [μm]	Physically relates to	Smaller contribution to the signal	Larger contribution to the signal
Red	NIR1.6	Cloud Phase (and cloud top particle size)	Thick ice clouds	Thick water clouds
Green	NIR2.25	Cloud top particle size (and phase)	Thick clouds with large particles	Thick clouds with small particles
Blue	VIS0.64	Cloud optical thickness	Thin clouds	Thick clouds

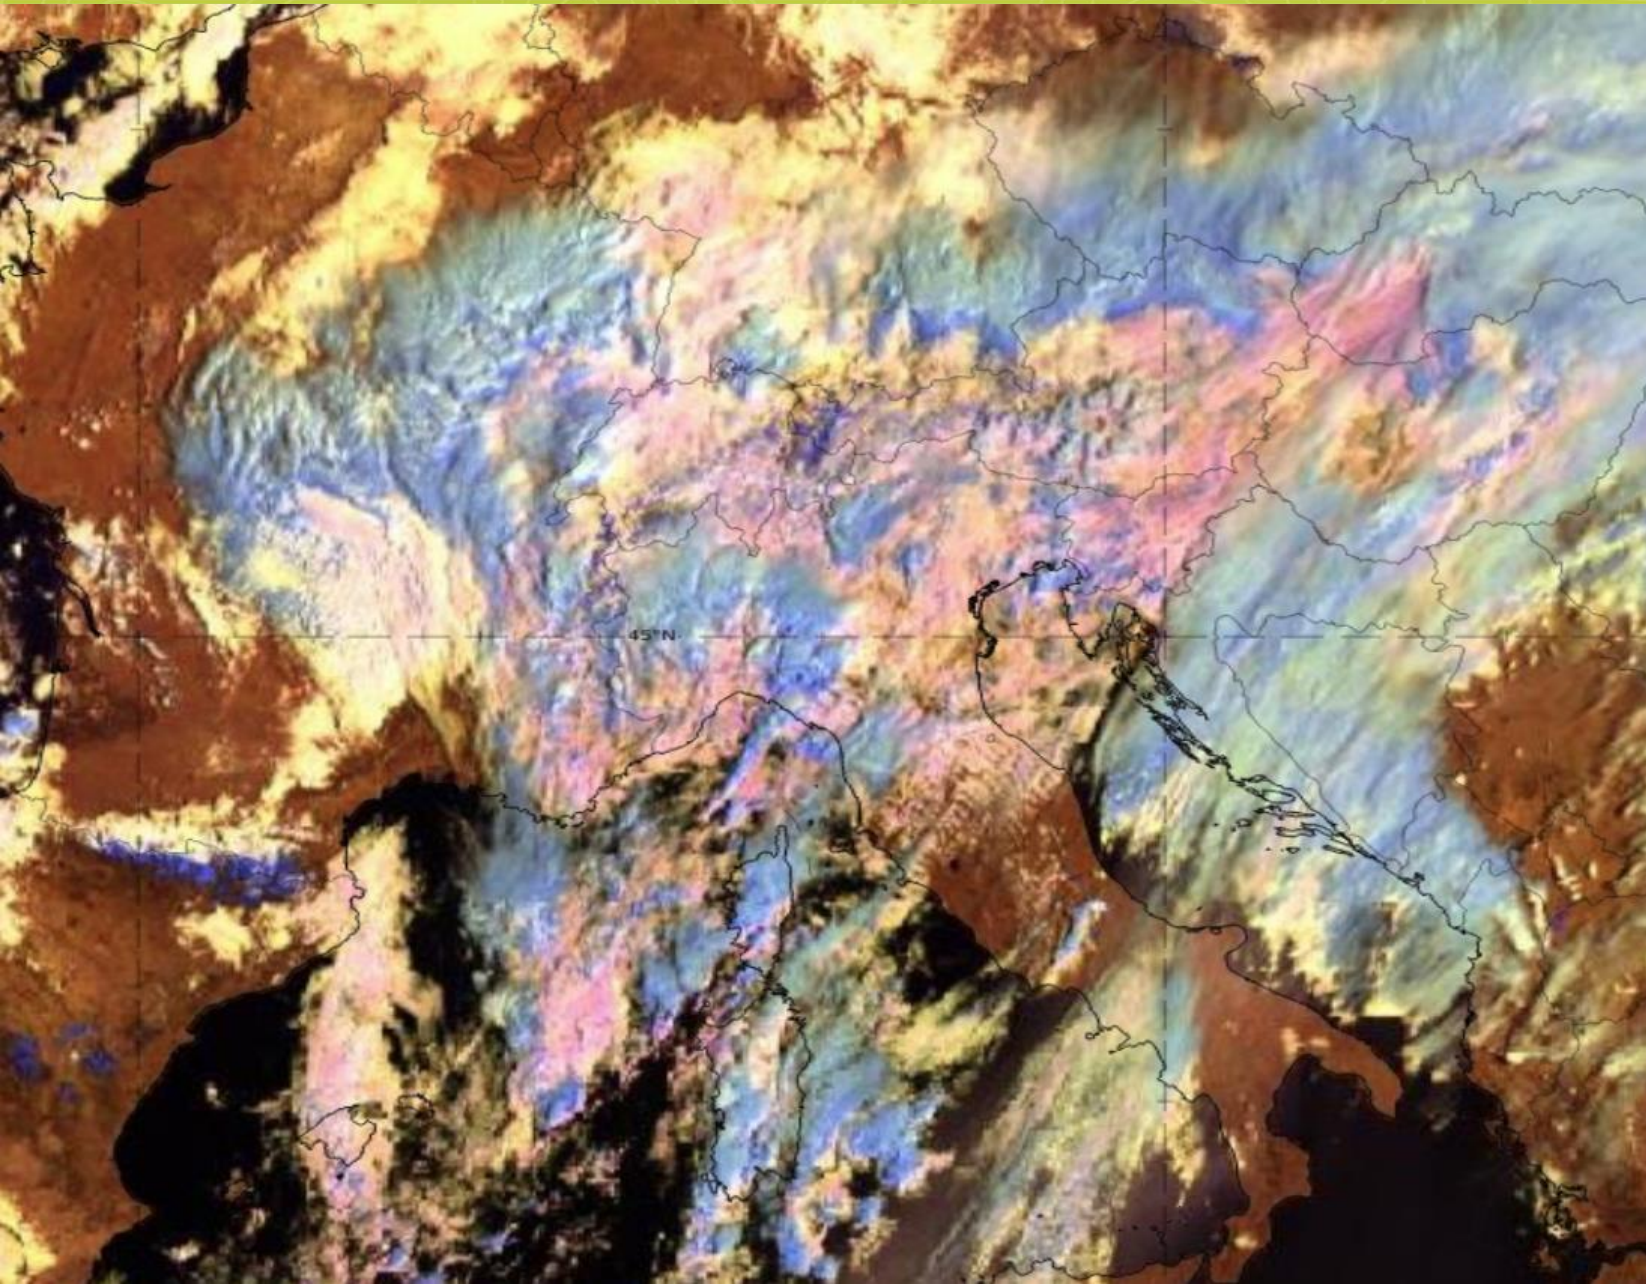

NIR2.25 is sensitive to the cloud phase.

This enhances (together with NIR1.6) the capability to discriminate between ice and water

Applications:

- Convection → CI, cloud top icing
- Cloud particle size

The Cloud Phase RGB

Water clouds

Very large drops

Large drops

Smaller drops

Even smaller drops

Ice clouds

Large particles

Small particles

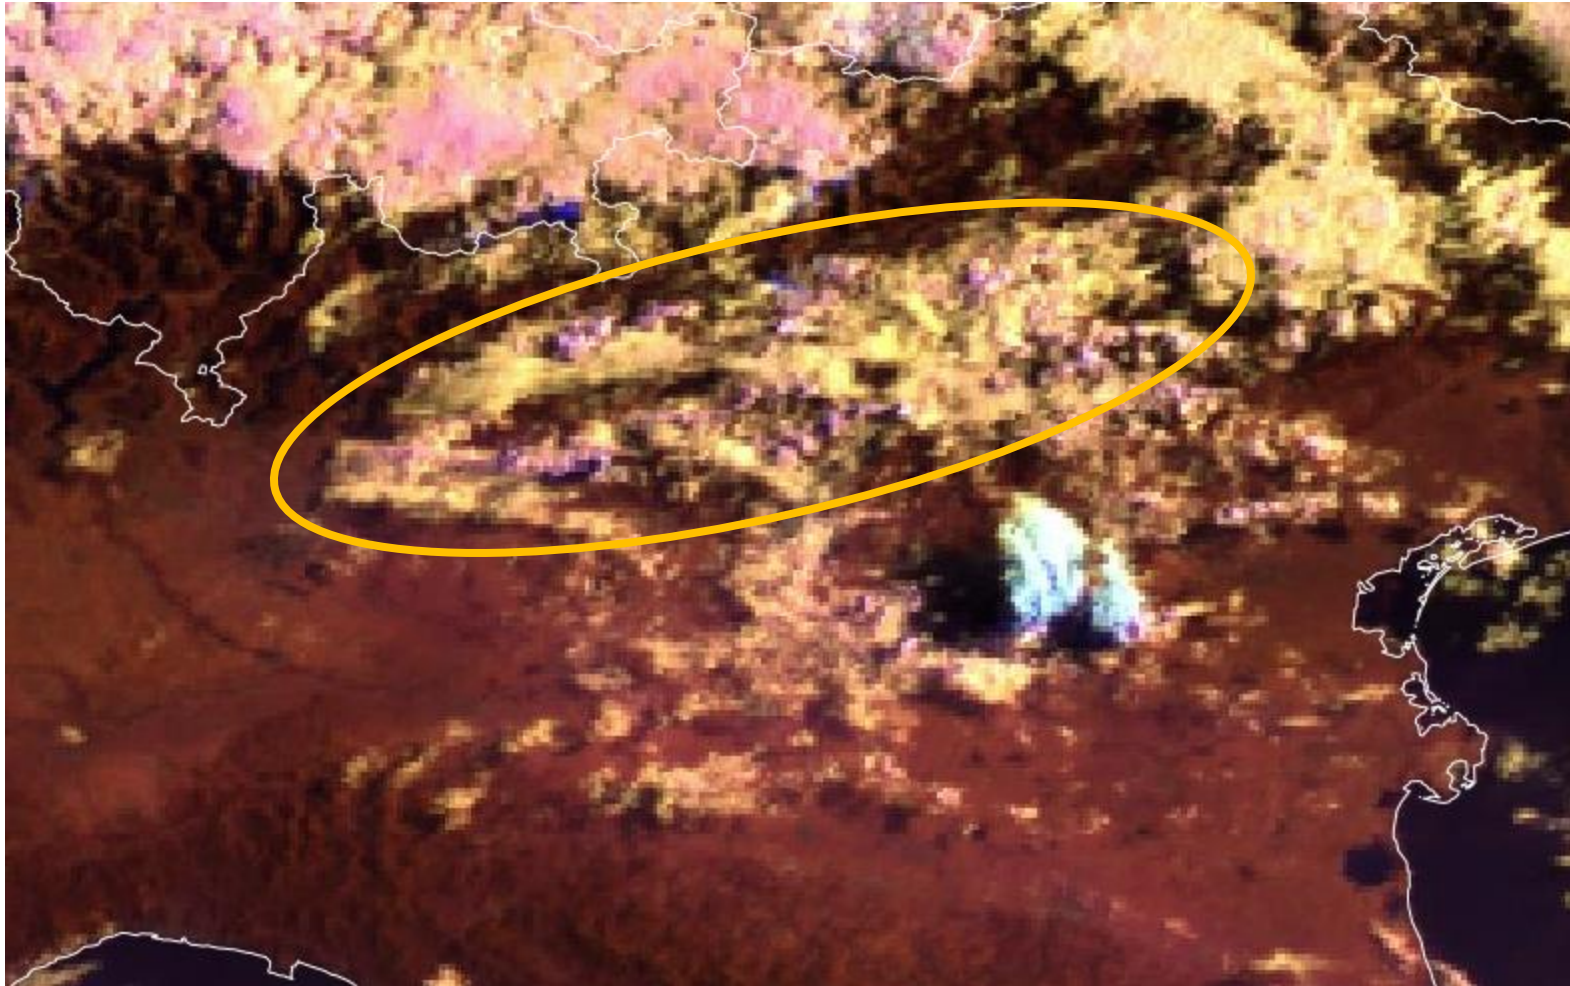

Snow

WARM

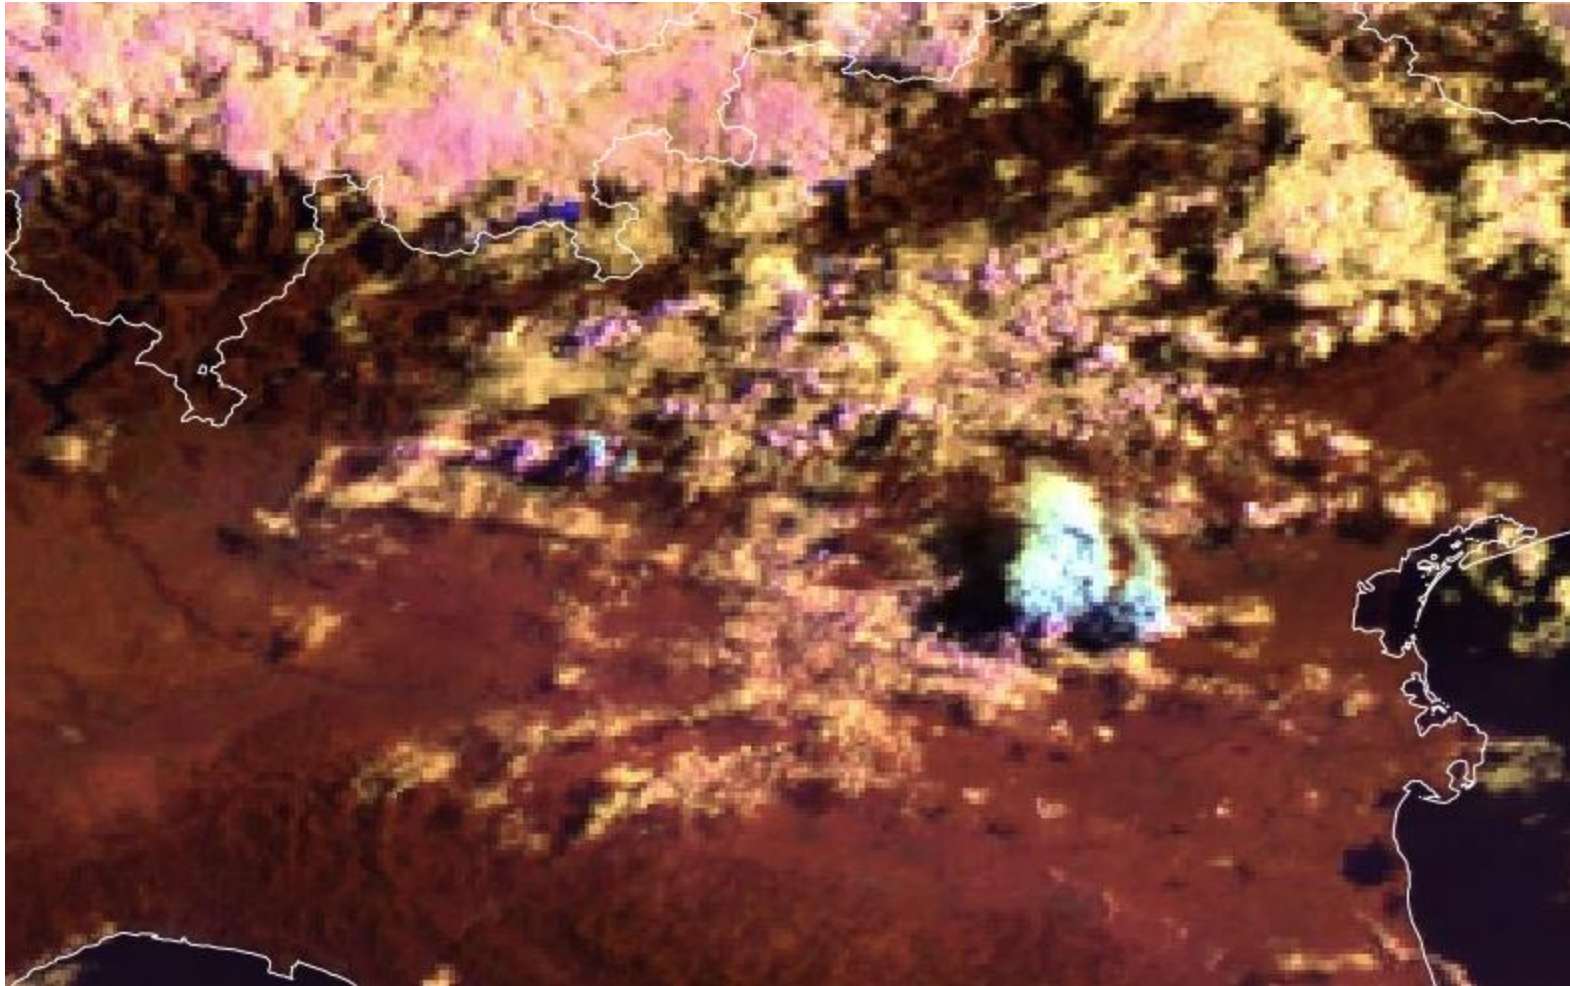

COLD

The Cloud Phase RGB – Convective Initiation

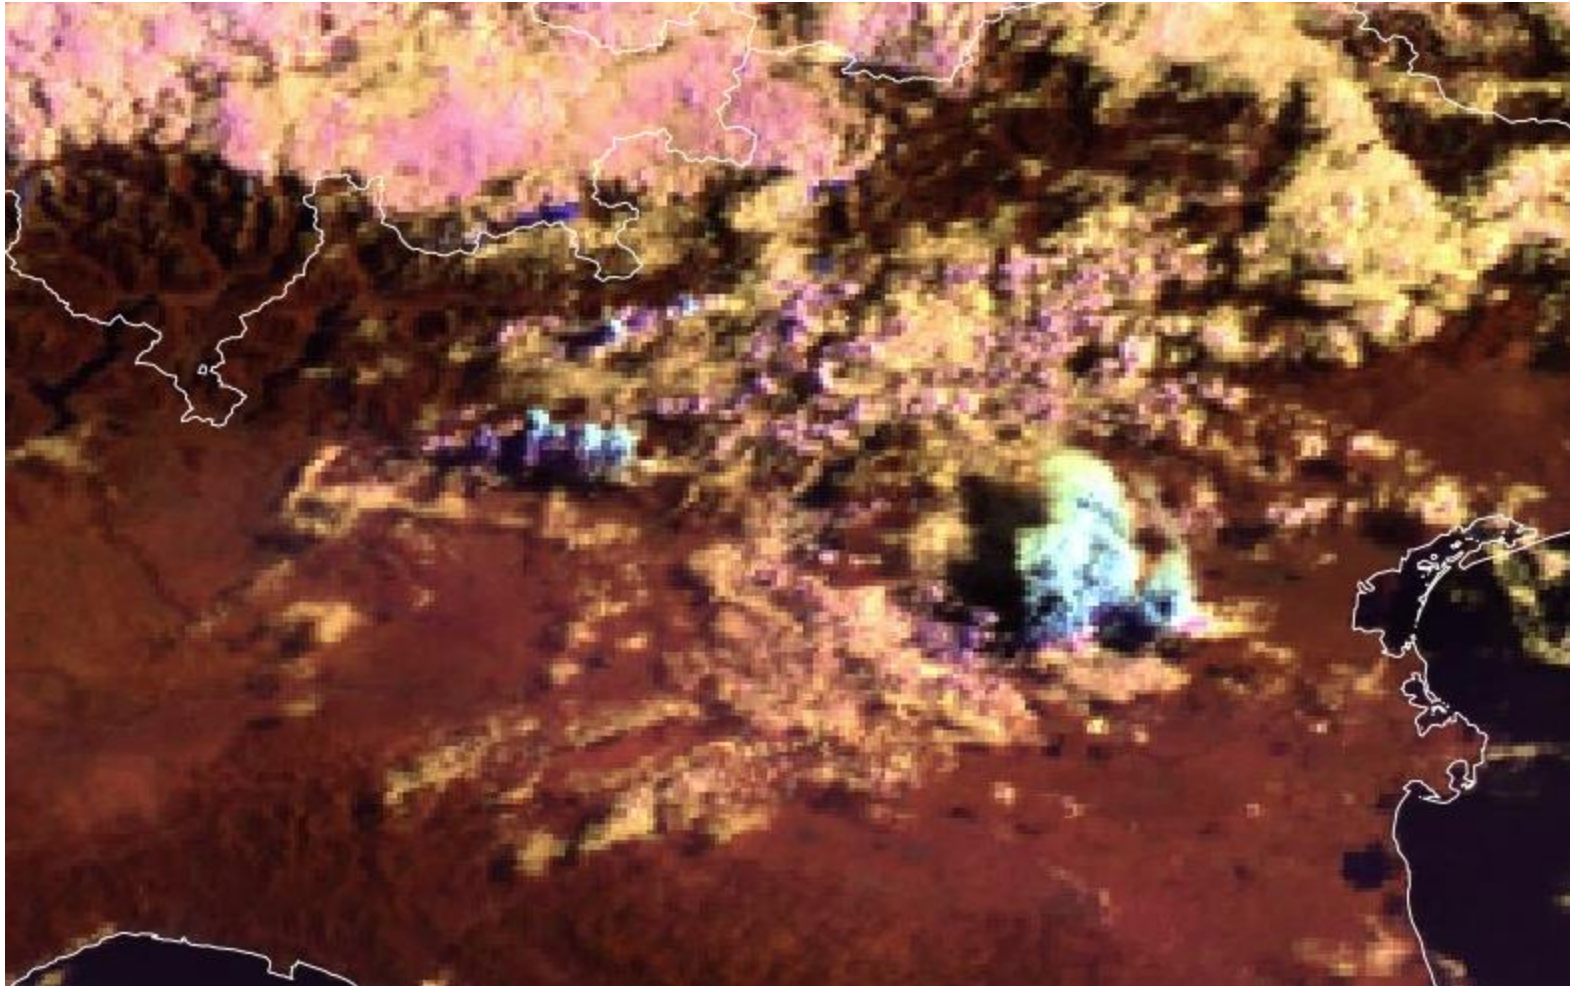

16 June 2025 – 06:00 UTC

The Cloud Phase RGB – Convective Initiation

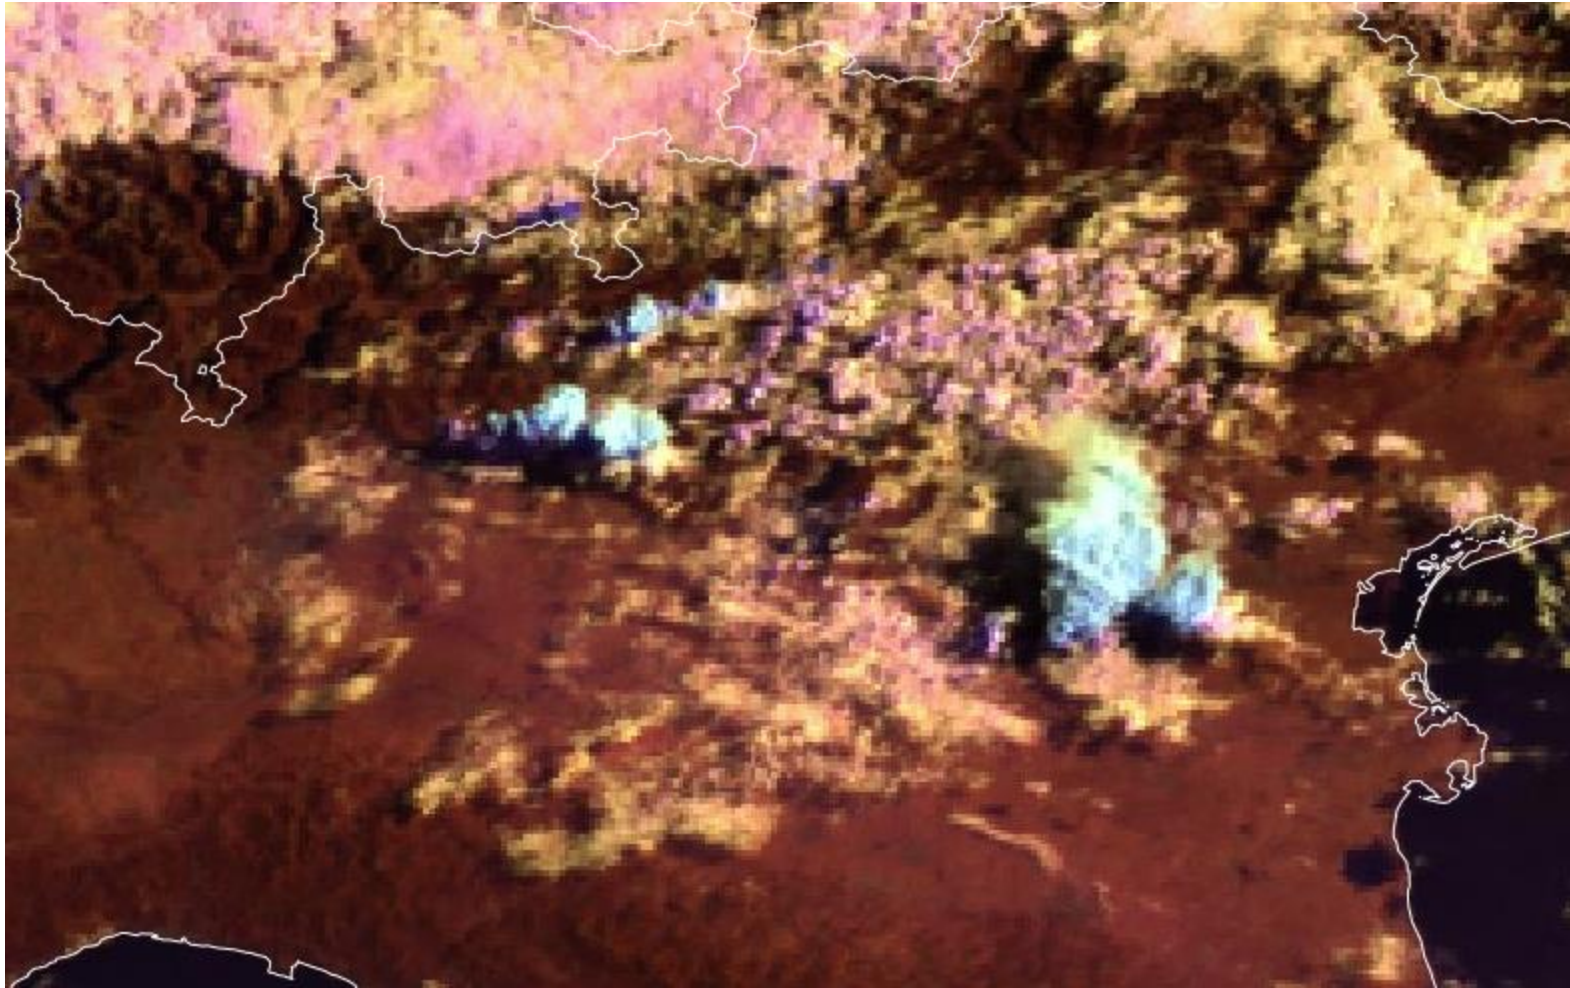

16 June 2025 – 06:10 UTC

The Cloud Phase RGB – Convective Initiation

16 June 2025 – 06:20 UTC

The Cloud Phase RGB – Convective Initiation

16 June 2025 – 06:30 UTC

Pros

- **Cloud phase information**
- **Particle size information**
- Useful for convective initiation

Cons

- **Daytime only**
- **No temperature information**
- Snow and ice clouds with similar colours (shades of blue)

The Cloud Type RGB

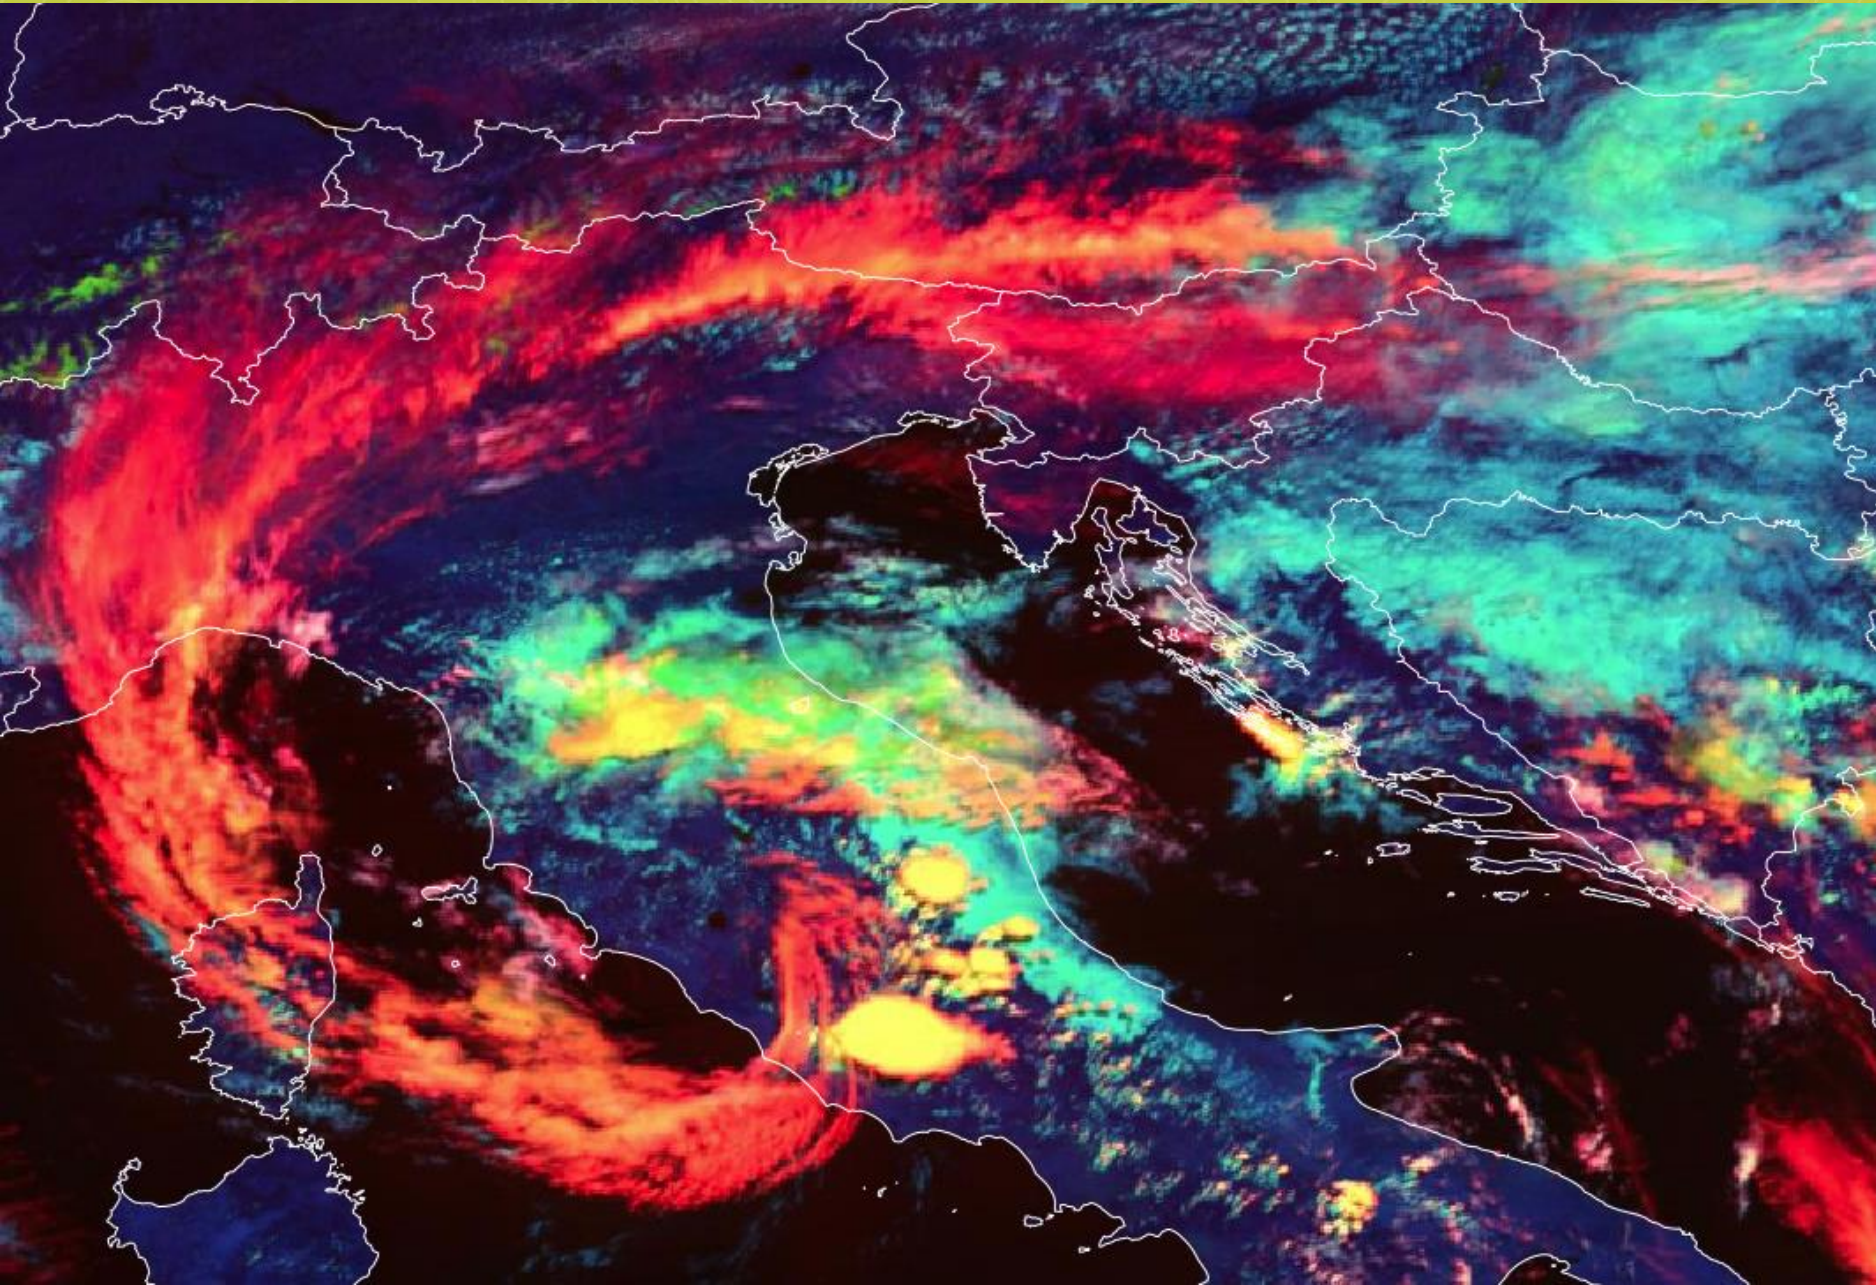

Colour	Channel [μm]	Physically relates to	Small contribution to the signal of	Large contribution to the signal of
Red	NIR 1.38	Cloud height and optical depth	Low-level clouds	High clouds
Green	VIS 0.64	Cloud optical thickness	Thin clouds	Thick clouds Snow covered land Sea ice
Blue	NIR 1.61	Cloud phase	Thick ice clouds Snow covered land	Thick water clouds

NIR1.38 is sensitive high-level water vapour (absorption band).

Applications:

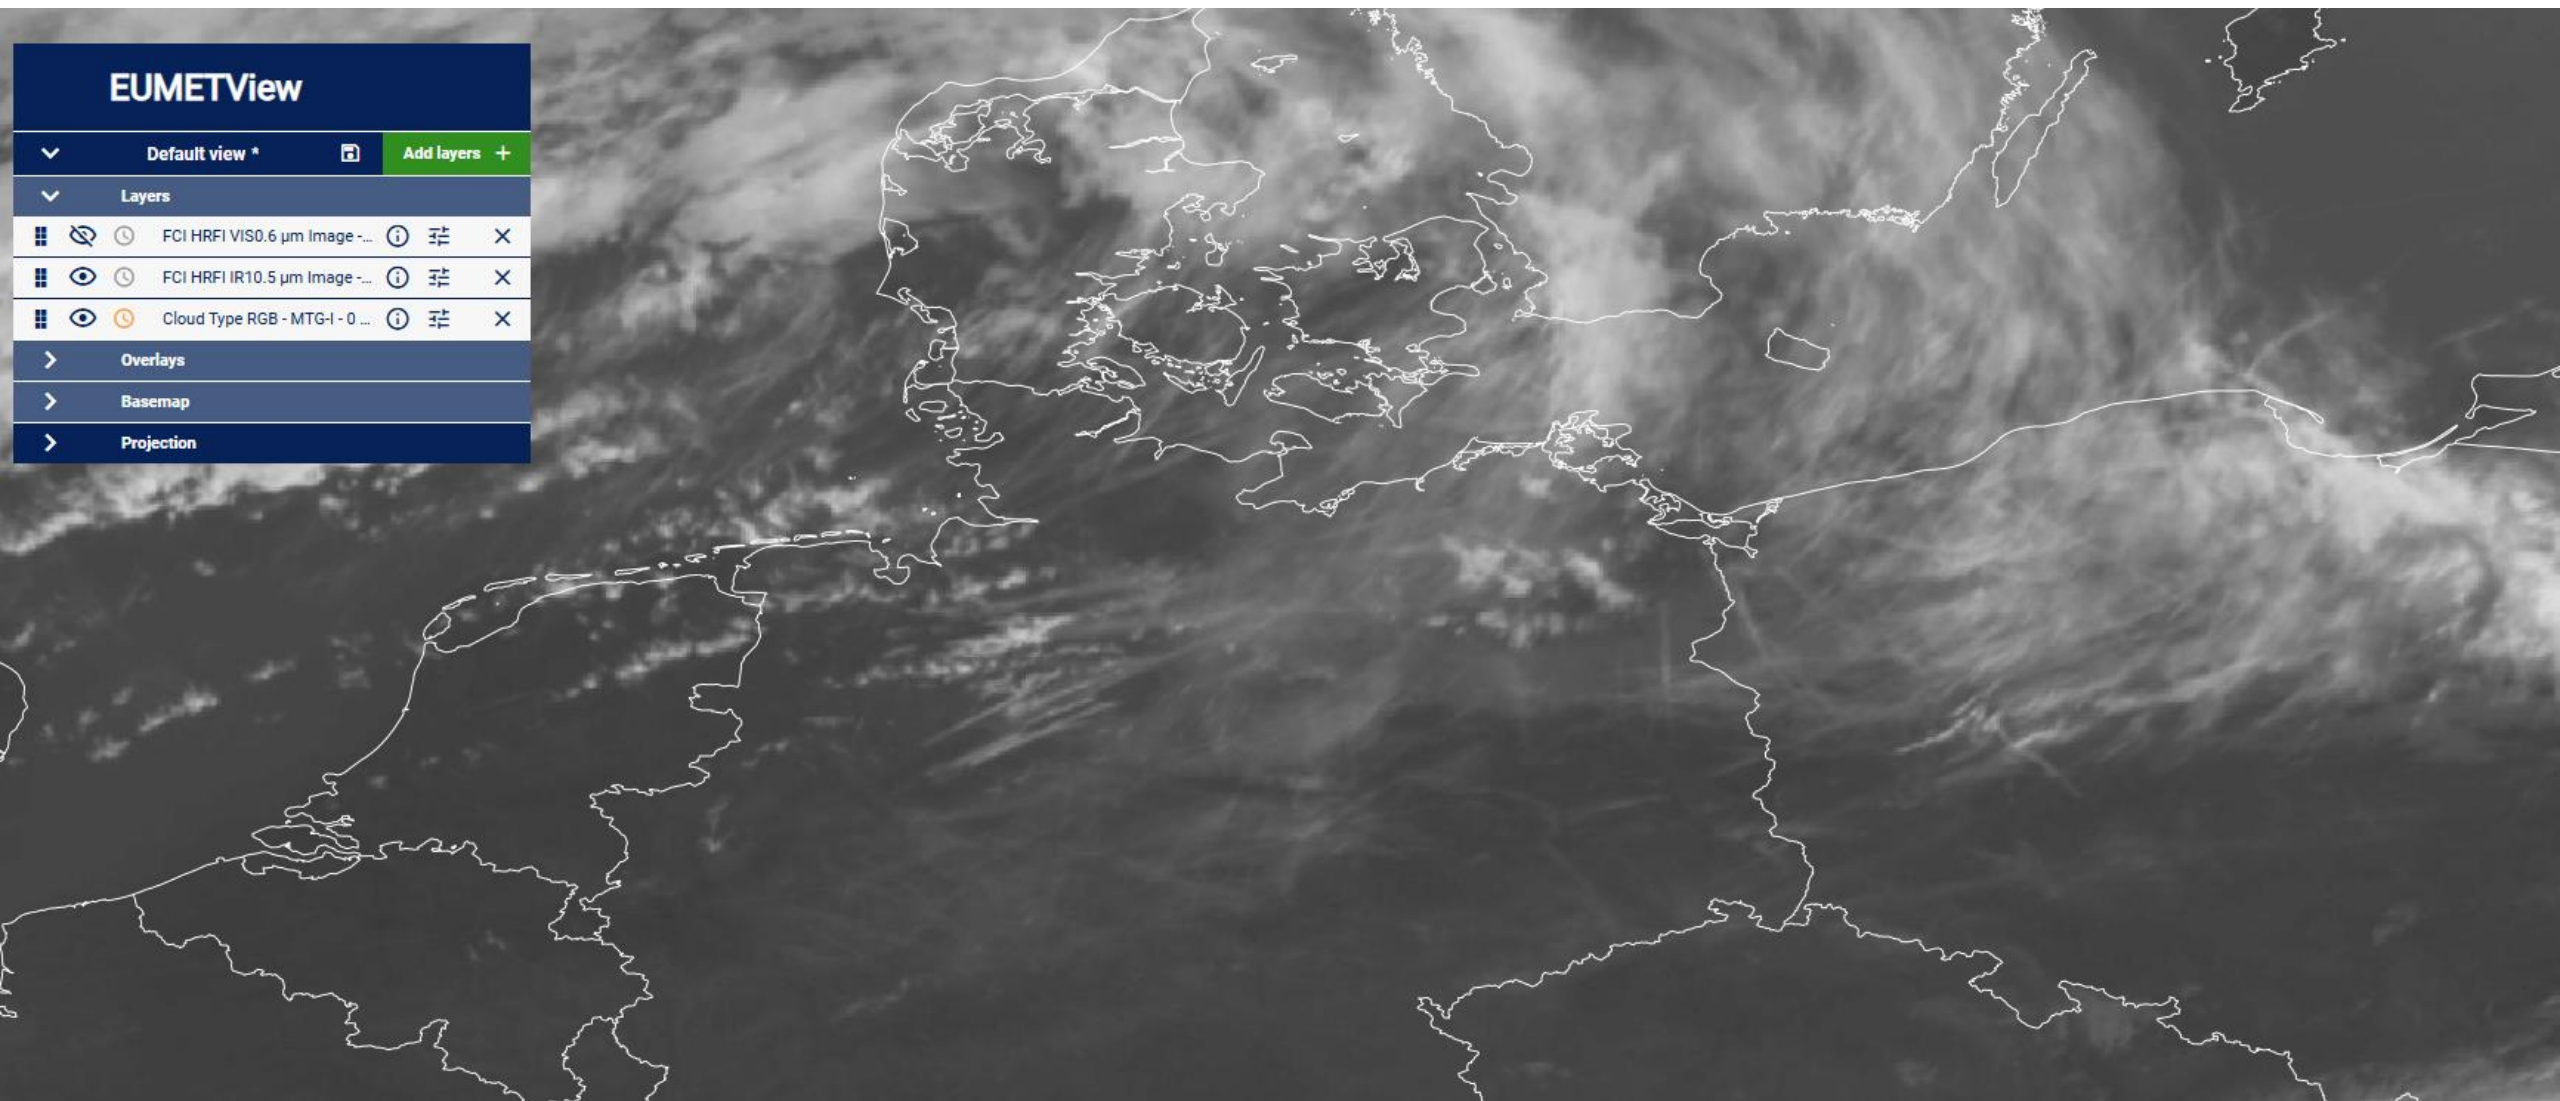

- **Cirrus cloud detection**
- **Discrimination of snow and ice on the ground**
- **Super-cooled water clouds**

The Cloud Type RGB

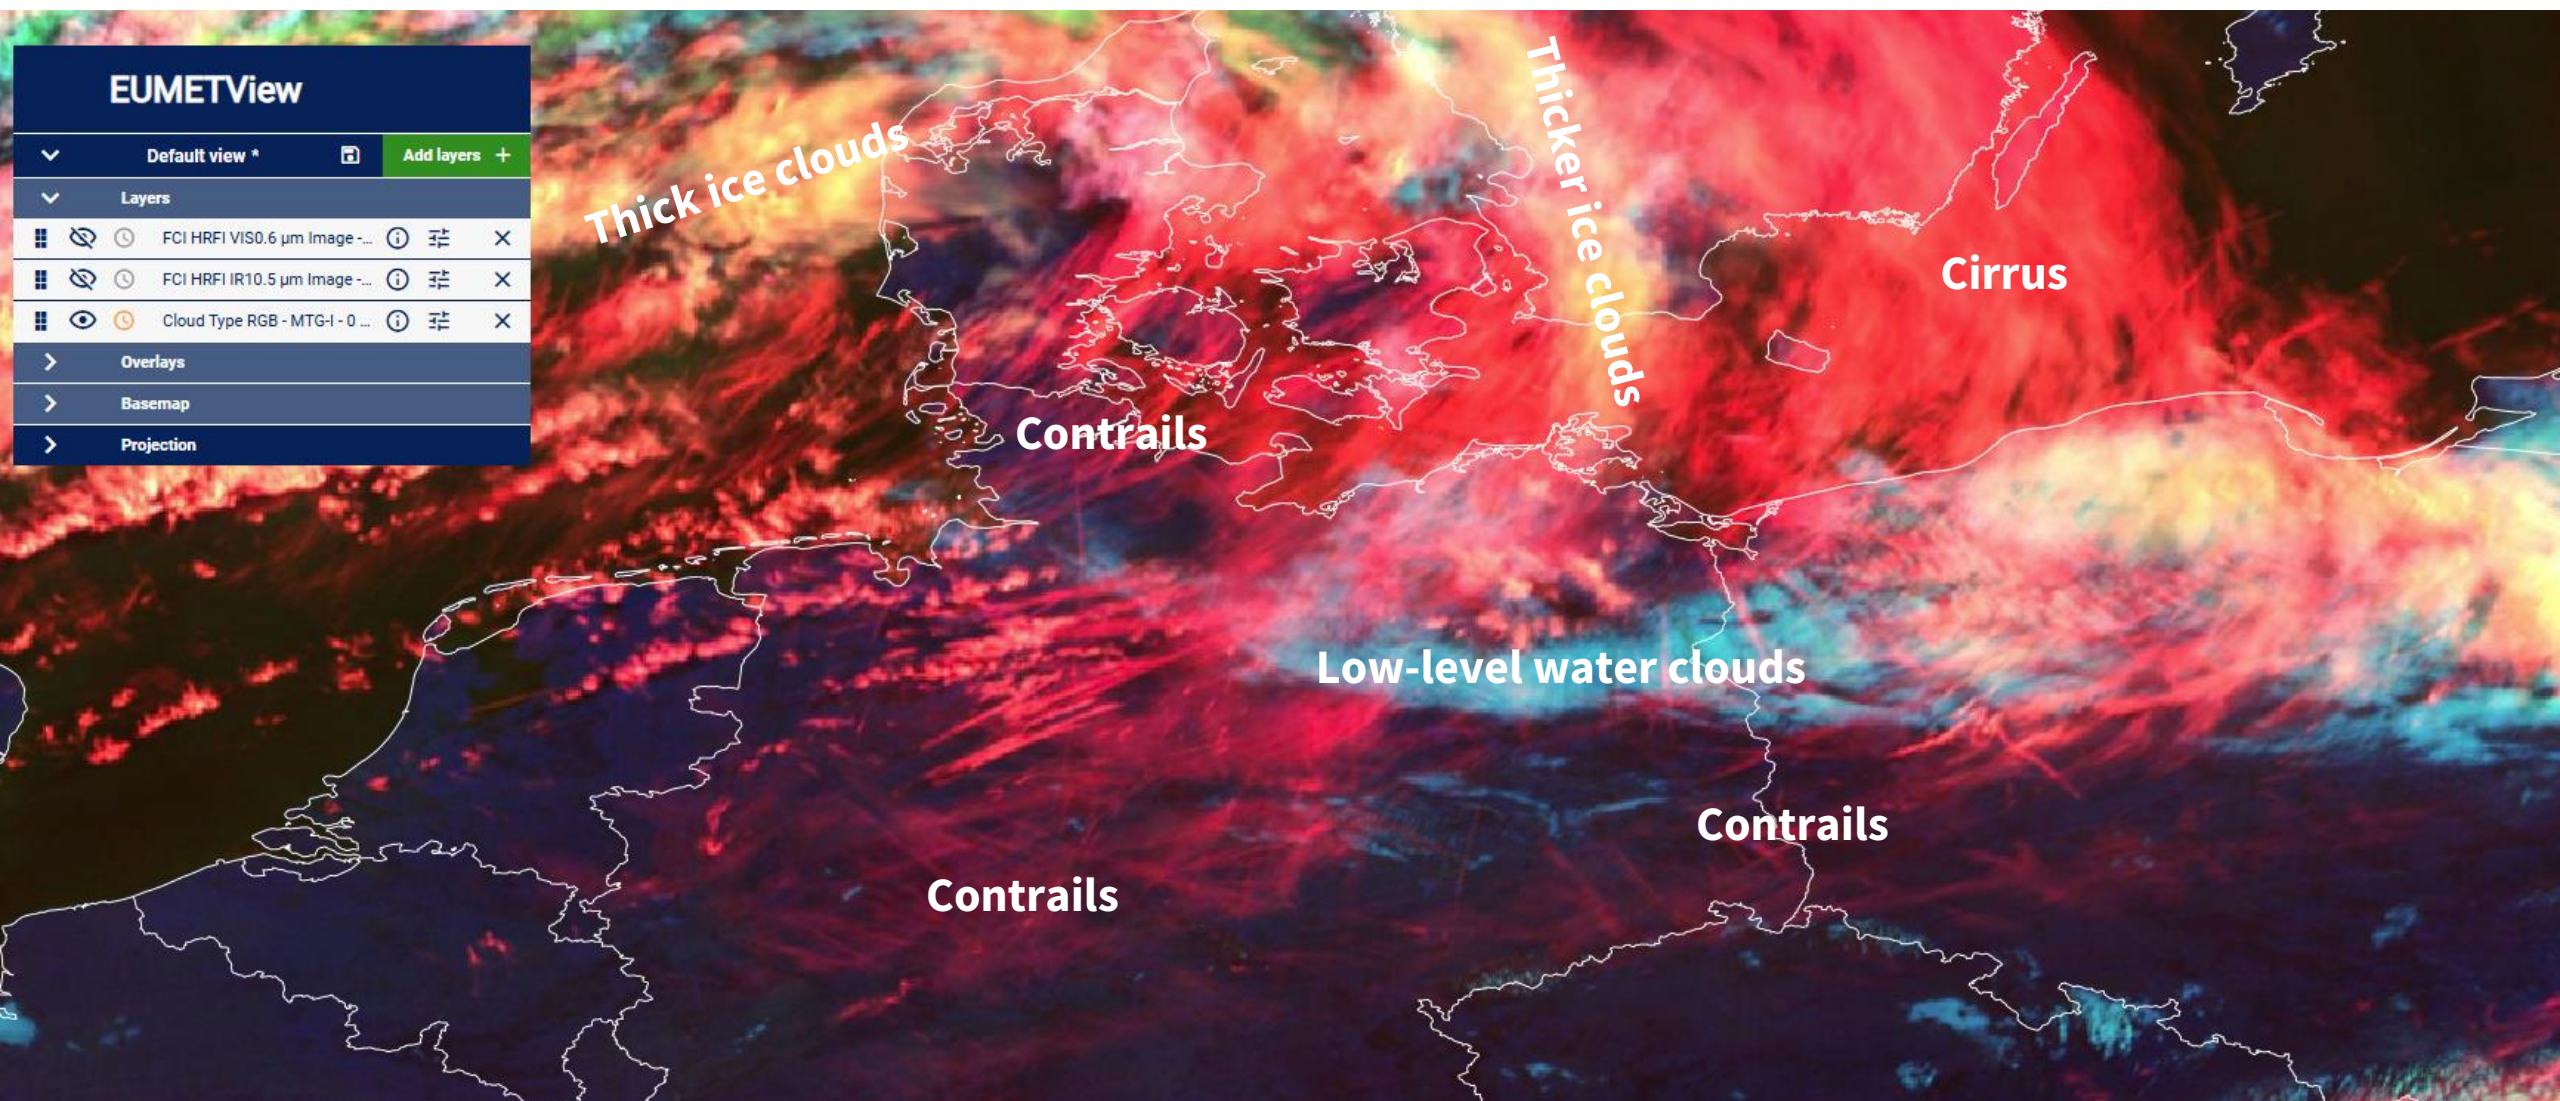

-  Optical thin ice clouds
-  Optical thick ice clouds
-  Low to mid-level water clouds
-  Low to mid-level mixed phase clouds
-  Mid-level thin water clouds
-  Super-cooled water clouds

Liaison Blog – GOES-R &
JPSS: The Future of Weather
Satellites; 2. Mai 2019

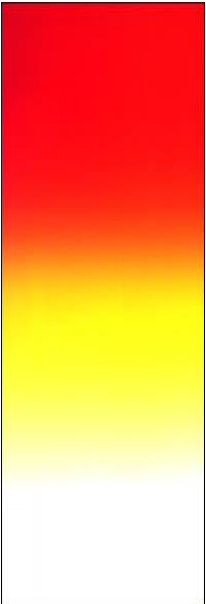

Pros

- **Thin Cirrus detection**
- **Discrimination of snow from ice clouds**
- **Detection of super-cooled water clouds**
- **Strong contrast between cloud types**

Cons

- **Daytime only**
- **Poor particle size information**
- **Thin Cirrus over thick ice clouds cannot be detected**
- **Colours depend on air moisture**

The Fire Temperature RGB

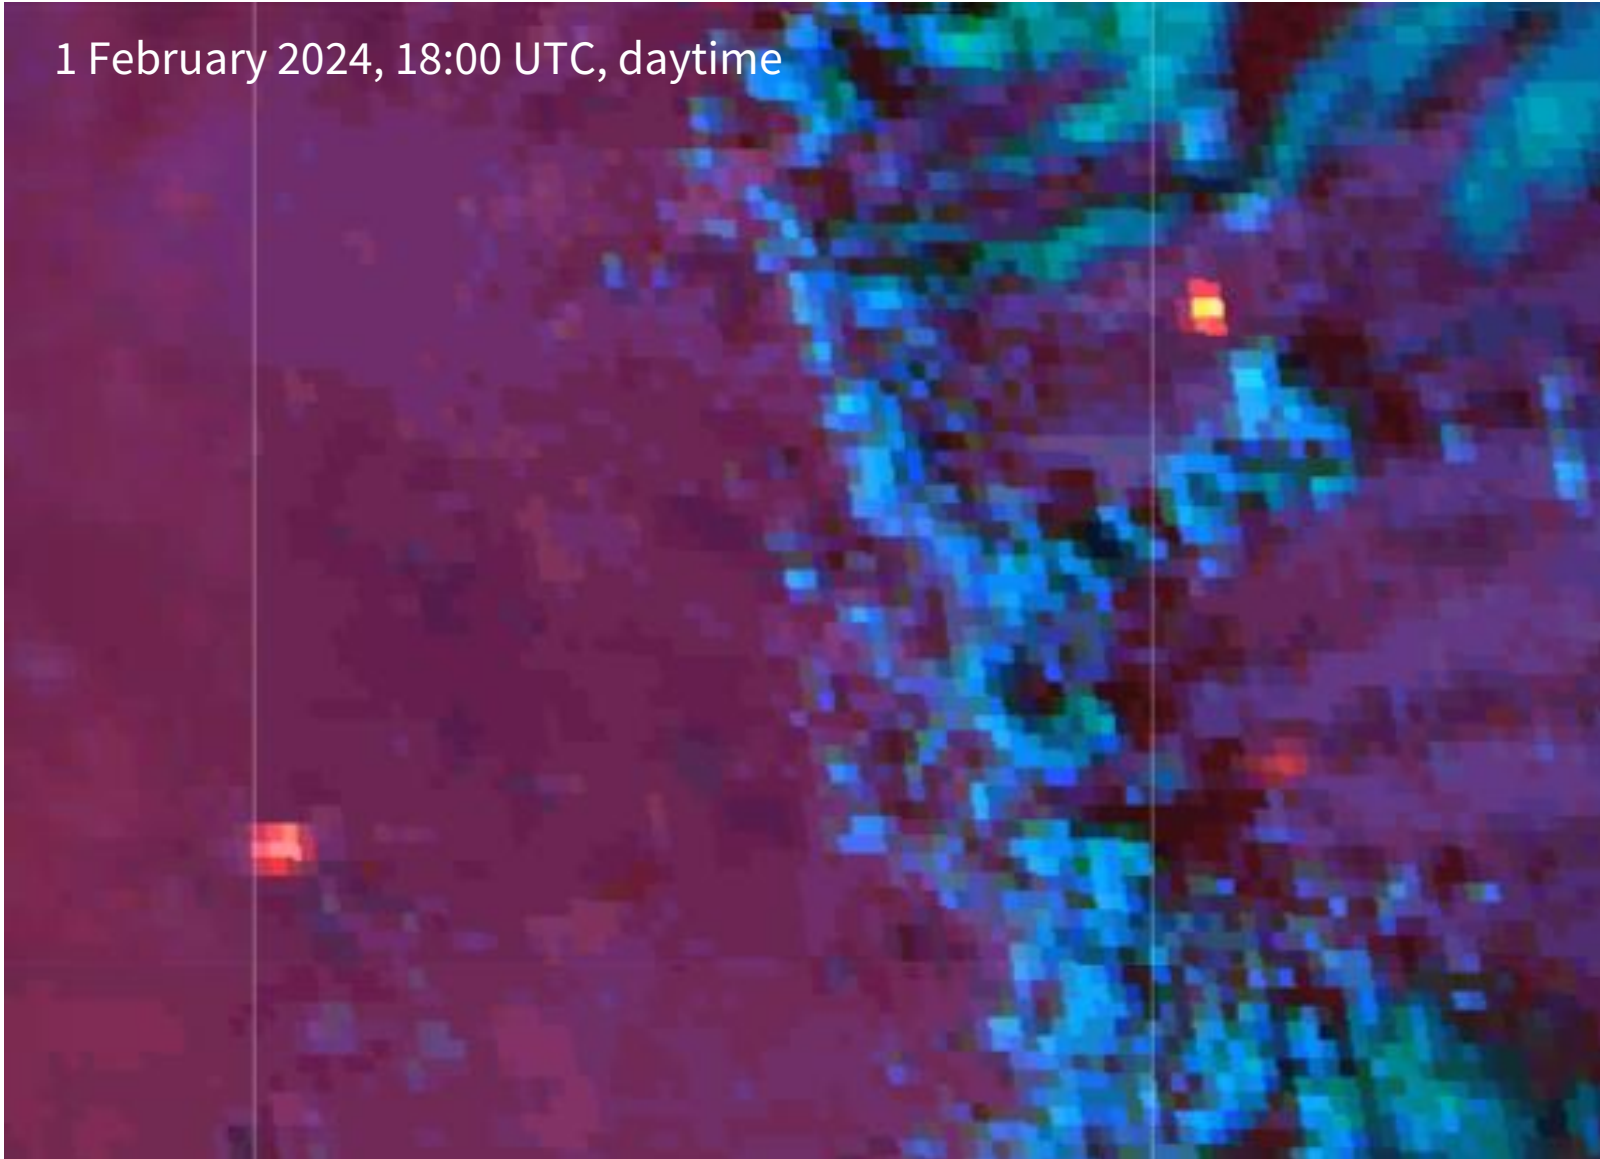

Colour	Channel [μm]	Physically relates to	Smaller contribution to the signal	Larger contribution to the signal
Red	IR3.7	(Fire) temperature <i>Cloud top microphysics</i>	Cold land surfaces <i>water, snow/ice, cold clouds</i>	Low fire temperature, hot spots <i>Warm land surfaces</i>
Green	NIR2.25	Fire temperature <i>Land type, cloud top particle size</i>	<i>Green vegetation, water, snow/ ice, large cloud particles</i>	Medium fire temperature, <i>Dry grass, bare ground, small cloud particles</i>
Blue	NIR1.6	Fire temperature <i>Land type, cloud top phase</i>	<i>Green vegetation, water, snow/ice, ice clouds</i>	High fire temperature <i>Dry vegetation, bare ground, water clouds</i>

Although this RGB contains only visible channels, it can be used day and night.

Also used by the Cloud Phase RGB

The Fire Temperature RGB

1 February 2024, 18:00 UTC, daytime

Low fire temperature

Medium fire temperature

High fire temperature

Extremely high fire temperature

Burnt surface (daytime)

Pros

- **Available 24 hours**
- **Information on fire intensity**
- Daytime information on ice and water clouds

Cons

- **Smoke from fires is not visible**
- **Fires can be hidden by clouds**
